

## FILTERS IN PARALLEL

For industrial, wastewater, and other dirty-water applications.

Dual filters improve reliability by reducing the cleaning/flushing frequency compared to using a single external filter. If one filter is plugged, the valve should still be able to function using the other filter.

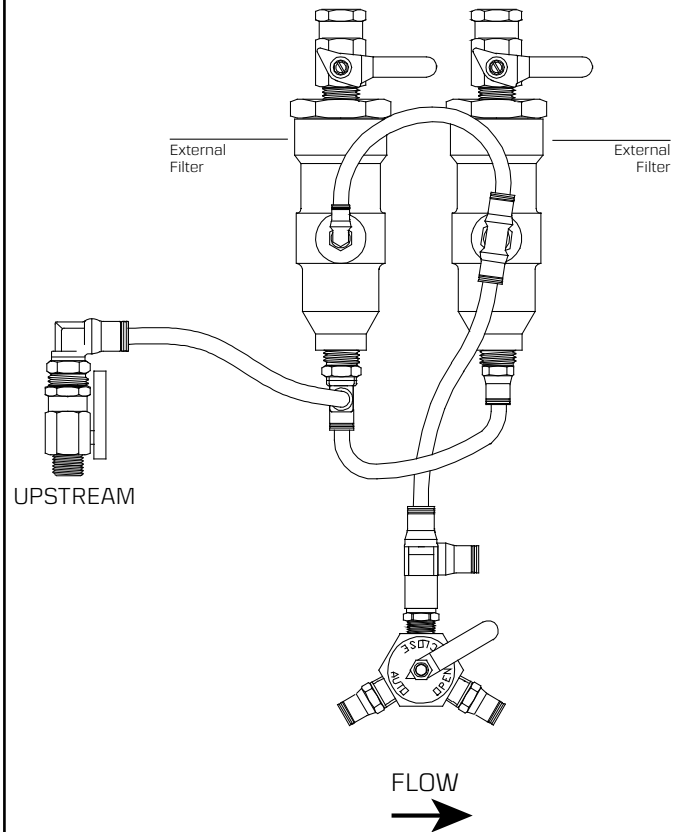

### Internal + External Filter

Combines the benefits of the self-cleaning internal filter with the ease of manually cleaning the external filter.

### Dual External Filters

Useful in applications where filters need to be manually cleaned/flushed frequently, or where experience has proven the internal filter inadequate.

The above options can be field-retrofitted to any valve configuration, but are not available configured on new valves from the factory. Every site is different and may require additional or alternative filtration for reliable operation. Contact Nelson Irrigation for specific application assistance.
